

The promise of quantum computers is that certain computational tasks might be executed exponential

Our Sycamore processor consists of a two-dimensional array of 54 transmon qubits, where each qubit

Cross-entropy benchmarking fidelity: We assess the fidelity of our quantum circuits by comparing the p

The Sycamore processor took approximately 200 seconds to sample one instance of a quantum circuit

Quantum error correction will be required to achieve fault-tolerant general-purpose quantum computing.

Calibration of single-qubit microwave drive pulses and two-qubit couplers is performed using randomiz
